What is Lyme disease?

Lyme disease is a bacterial infection that is transmitted to humans through the bite of an infected tick. The bacteria that causes Lyme disease is called *Borrelia burgdorferi*.

Lyme disease is a multisystemic disease, which means that it can affect multiple organs and systems in the body. The most common symptoms of Lyme disease include:

- Fatigue
- Headaches
- Joint pain
- Muscle pain
- Skin rashes
- Neurological problems

Lyme disease can be difficult to diagnose because the symptoms are often similar to those of other illnesses. If you think you may have Lyme disease, it's important to see your doctor right away.

How is Lyme disease treated?

The treatment for Lyme disease typically involves antibiotics. The type of antibiotic that is used will depend on the stage of the disease. In the early stages of Lyme disease, antibiotics can usually clear the infection.

However, in the later stages of Lyme disease, antibiotics may not be as effective.

In addition to antibiotics, there are a number of other treatments that can be used to relieve the symptoms of Lyme disease. These treatments may include:

- Pain relievers
- Anti-inflammatory medications
- Physical therapy
- Occupational therapy
